CIT 140 · Week 4 · Cedar Junction

Validated Requirements Set

CIT140-Week04-Validated-Requirements · Revision 51

R-01 · functional

Requirement: The system shall record and display a scheduling hold and an intake hold as two distinct, separately named statuses, so that no single status label represents both a slot awaiting final confirmation and an arrived visitor who cannot proceed.

Source: W04-S01 · Dana Ruiz

Rationale: W04-S01 records that Scheduling uses "held" for a slot awaiting final confirmation while Intake uses "held" for a visitor who has arrived but cannot move forward. One label covering two conditions is why a visitor holding a 9:30 confirmation was stopped at the desk. Dana Ruiz can confirm the intake workflow meaning (W04-S01).

Acceptance check: Create one appointment awaiting final confirmation and one arrived visitor who cannot proceed. Confirm the intake queue shows a different status name for each, and that neither displays the bare word "held". Dana Ruiz confirms the intake-side label matches intake practice.

Priority: Must · **Validation:** Confirmed by Dana Ruiz

Conflict or decision: Agreed decision: the single label "held" is retired and replaced by two separately named statuses. A scheduling hold means a slot is awaiting final confirmation. An intake hold means a visitor has arrived but cannot move forward. Neither view displays the bare word "held". Intake staff also see which condition applies, who last changed it, and the next approved step. Confirmed by Dana Ruiz, who validates the intake workflow (W04-S01). Dana did not approve privacy or clinical capacity aspects; those were confirmed by Jordan Kim and Dr. Lena Okafor in their own topics. Traces to R-01 and R-02.

R-02 · functional

Requirement: When a visitor record is in an exception status, the system shall display to intake staff which condition applies, the identity of the person who last changed the status, and the next approved step for that condition.

Source: W04-S01 · Dana Ruiz

Rationale: Dana Ruiz states that staff must see which condition applies, who changed it, and the next approved step, and that without this they call around while the visitor waits (W04-S01). Showing the condition, the owner of the change and the next step removes the phone calls from the critical path.

Acceptance check: Place a test record into an exception status and confirm the intake view shows all three elements: the specific condition, the name of the person who last changed the status, and a stated next step. Dana Ruiz confirms the next step shown matches the approved intake workflow.

Priority: Must · **Validation:** Confirmed by Dana Ruiz

Conflict or decision: Agreed decision: the single label "held" is retired and replaced by two separately named statuses. A scheduling hold means a slot is awaiting final confirmation. An intake hold means a visitor has arrived but cannot move forward. Neither view displays the bare word "held". Intake staff also see which condition applies, who last changed it, and the next approved step. Confirmed by Dana Ruiz, who validates the intake workflow (W04-S01). Dana did not approve privacy or clinical capacity aspects; those were confirmed by Jordan Kim and Dr. Lena Okafor in their own topics. Traces to R-01 and R-02.

R-03 · business

Requirement: The system shall offer a same-day slot only when both a room and a qualified clinician are recorded as available for that slot; an open calendar time alone shall not make a same-day slot offerable.

Source: W04-S02 · Dr. Lena Okafor

Rationale: W04-S02 states a same-day slot may be offered only after a room and qualified clinician are available, and Dr. Lena Okafor states that an open time on the calendar does not prove either is ready. Clinical Operations needs the readiness state known before Intake promises a start time, so the rule has to sit in the offer condition rather than in staff judgement.

Acceptance check: Set a calendar opening with no available room, then with no qualified clinician, and confirm the slot is not offerable in either case. Set both available and confirm it becomes offerable. Dr. Lena Okafor confirms the readiness conditions match the capacity rule.

Priority: Must · **Validation:** Confirmed by Dr. Lena Okafor

Conflict or decision: Agreed decision: a confirmed appointment does not by itself mean the service is ready. A same-day slot may be offered only after both a room and a qualified clinician are recorded as available; an open calendar time is not evidence of either. When readiness changes after confirmation, affected staff and the visitor receive an updated expectation containing only what they need in order to act, without clinical detail. Confirmed by Dr. Lena Okafor, who validates capacity and readiness rules (W04-S02). She did not decide the technical implementation. Traces to R-03 and R-04.

R-04 · functional

Requirement: When readiness for a confirmed appointment changes, the system shall notify the affected staff and the visitor with an updated expectation, limited to the information each needs to act and excluding clinical detail.

Source: W04-S02 · Dr. Lena Okafor

Rationale: Dr. Lena Okafor states that when readiness changes the affected staff and visitor need an updated expectation and do not need clinical details, only the information required to act (W04-S02). This keeps people informed without widening access to clinical information, which Lena does not control and Jordan Kim governs under minimum access (W04-S04).

Acceptance check: Change readiness on a confirmed appointment and confirm that affected staff and the visitor each receive an updated expectation, and that neither message contains clinical detail. Dr. Lena Okafor confirms the content is sufficient to act on; Jordan Kim confirms it meets minimum-access rules.

Priority: Must · **Validation:** Confirmed by Dr. Lena Okafor

Conflict or decision: Agreed decision: a confirmed appointment does not by itself mean the service is ready. A same-day slot may be offered only after both a room and a qualified clinician are recorded as available; an open calendar time is not evidence of either. When readiness changes after confirmation, affected staff and the visitor receive an updated expectation containing only what they need in order to act, without clinical detail. Confirmed by Dr. Lena Okafor, who validates capacity and readiness rules (W04-S02). She did not decide the technical implementation. Traces to R-03 and R-04.

R-05 · functional

Requirement: The system shall carry a visitor’s recorded language, communication and approved support needs with the appointment, and make them available to authorized staff at confirmation, rescheduling and check-in without the visitor restating them.

Source: W04-S03 · Priya Shah

Rationale: W04-S03 records that the visitor’s communication preference appeared in the access team’s view but not in the intake queue, and that a support request must follow the appointment through confirmation, rescheduling and check-in. Priya Shah states the visitor had to explain the same need again after arriving. Persisting the need with the appointment removes that repetition.

Acceptance check: Record a communication and support need at booking, then reschedule the appointment and check the visitor in. Confirm the need is visible to authorized staff at all three points without re-entry. Priya Shah confirms the fields match approved access needs; Jordan Kim confirms visibility follows role-based access (W04-S04).

Priority: Must · **Validation:** Confirmed by Priya Shah

Conflict or decision: Agreed decision: a visitor's recorded language, communication and approved support needs travel with the appointment and remain visible to authorized staff at confirmation, rescheduling and check-in, so the visitor is not asked to restate them on arrival. Where the visitor cannot use the portal, an equivalent phone or staff-assisted route provides the same functions, so access does not depend on a single digital channel. Confirmed by Priya Shah, who validates access and communication needs (W04-S03). Priya did not approve field-level permissions; visibility follows the role-based access boundary confirmed by Jordan Kim. Traces to R-05 and R-06.

R-06 · constraint

Requirement: The system shall provide a phone or staff-assisted route equivalent to every visitor-portal function required to book, reschedule, confirm and check in, so that access to the service does not depend on the portal.

Source: W04-S03 · Priya Shah

Rationale: Priya Shah states the process needs an equivalent phone or staff-assisted route and that access to the service cannot depend on one digital channel (W04-S03). Stating this as a constraint keeps the alternative route a property of the service rather than an optional feature, and avoids excluding visitors who cannot use the portal.

Acceptance check: List the functions a visitor can perform in the portal, then complete each one by phone or with staff assistance and confirm the same result is achieved and recorded identically. Priya Shah confirms the alternative route meets access needs.

Priority: Must · **Validation:** Confirmed by Priya Shah

Conflict or decision: Agreed decision: a visitor's recorded language, communication and approved support needs travel with the appointment and remain visible to authorized staff at confirmation, rescheduling and check-in, so the visitor is not asked to restate them on arrival. Where the visitor cannot use the portal, an equivalent phone or staff-assisted route provides the same functions, so access does not depend on a single digital channel. Confirmed by Priya Shah, who validates access and communication needs (W04-S03). Priya did not approve field-level permissions; visibility follows the role-based access boundary confirmed by Jordan Kim. Traces to R-05 and R-06.

R-07 · nonfunctional

Requirement: The system shall limit shared displays to the minimum status information staff need for the task at hand, and shall release any further detail only to staff whose role carries authorized access to it.

Source: W04-S04 · Jordan Kim

Rationale: W04-S04 records that shared displays show only the minimum information staff need, with detailed access following staff roles. Jordan Kim validates access and audit constraints (W04-S04). Stating the limit as a property of the display keeps the minimum-access rule from depending on who happens to be standing nearby.

Acceptance check: Open a shared display and confirm it shows status only, with no detail beyond what the task requires. Sign in as roles with and without authorized access and confirm the additional detail appears only for the authorized role. Jordan Kim confirms the displayed set meets minimum access.

Priority: Must · **Validation:** Confirmed by Jordan Kim

Conflict or decision: Agreed decision: shared displays carry only the minimum status information staff need for the task, and any further detail is released only to staff whose role carries authorized access. Every status change retains who made it, the previous value, the new value and the time, and that history stays available to authorized staff during an exception review. This audit record is what allows the intake exception view to show who last changed a status. Confirmed by Jordan Kim, who validates access, audit and availability constraints (W04-S04). Jordan did not confirm clinical readiness. Traces to R-07, R-08 and supports R-02.

R-08 · functional

Requirement: The system shall retain, for every status change, the identity of the person who made the change, the previous value, the new value and the time of change, and shall keep that history available to authorized staff during an exception review.

Source: W04-S04 · Jordan Kim

Rationale: W04-S04 records that the system retains who changed a status, its previous value, its new value and the time of change. Jordan Kim adds that the history must remain available during an exception review. This is also what makes R-02 checkable, since intake staff can only be shown who last changed a status if the change history records it.

Acceptance check: Change a status, then open the change history and confirm all four elements are recorded: person, previous value, new value and time. Trigger an exception review and confirm the history is still reachable by an authorized reviewer. Jordan Kim confirms the retained fields and their availability.

Priority: Must · **Validation:** Confirmed by Jordan Kim

Conflict or decision: Agreed decision: shared displays carry only the minimum status information staff need for the task, and any further detail is released only to staff whose role carries authorized access. Every status change retains who made it, the previous value, the new value and the time, and that history stays available to authorized staff during an exception review. This audit record is what allows the intake exception view to show who last changed a status. Confirmed by Jordan Kim, who validates access, audit and availability constraints (W04-S04). Jordan did not confirm clinical readiness. Traces to R-07, R-08 and supports R-02.

Professional Guidance Assessment

IIBA: IIBA, the International Institute of Business Analysis, defines what the business analyst role does and how the work is carried out. Through A Guide to the Business Analysis Body of Knowledge (BABOK Guide) it describes practices such as eliciting information from stakeholders, collaborating with them, analysing and specifying what is needed, and managing requirements across their life cycle, including tracing and validating them. IIBA also maintains professional certification for analysts. In Week 4 terms, IIBA explains the process I followed: asking each stakeholder about their work, checking the answer against the source record, drafting a requirement, and then validating it with the person whose authority covers it.

ISO/IEC/IEEE 29148: ISO, IEC and IEEE jointly publish ISO/IEC/IEEE 29148, Systems and software engineering, Life cycle processes, Requirements engineering. ISO is the International Organization for Standardization, IEC is the International Electrotechnical Commission, and IEEE is the Institute of Electrical and Electronics Engineers; publishing jointly means one agreed international standard rather than three competing ones. Where IIBA explains the analyst process, 29148 guides the quality and structure of the requirements themselves. It sets out characteristics each requirement should have, including being necessary, unambiguous, singular, feasible, verifiable and traceable, and it describes how requirements documents are organised. That is the standard I applied when writing each statement in shall form with a named source and an acceptance check.

PMI: PMI, the Project Management Institute, is related because requirements become the basis for a project's scope, schedule, cost and delivery, and because someone has to manage the work that implements them. Its guidance, such as the PMBOK Guide, addresses how projects are planned, executed and controlled. It is not the main Week 4 source because this week's task is not managing a project: it is eliciting requirements from stakeholders, writing them so they can be verified, and validating them with the people who hold the relevant authority. That is business analysis and requirements engineering, which IIBA and ISO/IEC/IEEE 29148 address directly. PMI would become more relevant once the Cedar Junction work is authorised and scheduled.

Application: The verifiability criterion in ISO/IEC/IEEE 29148 changed R-01. My first framing of the intake problem was that the system should avoid confusing the two meanings of held, which states a goal rather than something anyone can test. Applying the standard's requirement that each statement be unambiguous, singular and verifiable, I rewrote it as a shall statement requiring a scheduling hold and an intake hold to exist as two distinct, separately named statuses, with no view displaying the bare word held. That version can be checked directly: create one slot awaiting confirmation and one arrived visitor who cannot proceed, then confirm the queue shows different status names for each. The traceability criterion also made me record the link between R-08 and R-02, because intake staff can only be shown who last changed a status if the change history retains it.

Prepared in Command Nexus. Canvas remains the official submission point.
