Proposed QA Control Review / participation and decision rights

PEOPLE	RELATIONSHIPS	NEXT CONVERSATIONS
Who is affected?	Who contributes and decides?	What needs confirmation?

1. People and roles

QA and night-shift operators

Nia Voss, night QA supervisor, supervises the night shift and can describe how the cell is used on it. She can review whether the proposed record-checking workflow fits QA work. She needs original evidence preserved and review sessions arranged around shift duties. Her influence is over whether the workflow is practical; her account does not establish authority to approve funding or a restart (W03-S01).

Night-shift operators perform the checks and record exceptions, so the workflow being designed lands directly on their work. They have little formal authority and no spending approval, but they hold knowledge of the shift that Nia cannot supply on their behalf.

Separating the two accounts: the packet contains Nia's account, not interviews with every operator (W03-S01). Nia has asked that an operator participate in checking the workflow, and that operator has not yet been selected or interviewed. That is recorded here as a missing voice, not as someone already consulted.

Engineering

Contribution. Elias Chen, robotics systems engineer, can explain the available command and scheduler records and review technical interpretations of them (W03-S02).

Needs. He needs read-only exports that include source details, not bare extracts. He also asks that the record custodian attend a short access discussion before anyone promises delivery dates (W03-S02), so his participation depends on a contact the packet does not name.

Limits. He cannot identify the origin of the repeated command from the evidence supplied so far (W03-S02). His knowledge of the records does not mean he owns them or controls access to them, and a proposed restart is not a confirmed solution.

Expertise is not authority. W03-S02 states that technical expertise is not proof that he owns every record or can authorize spending. Elias advises on technical feasibility; the sponsor authorizes work and funding, and Operations routes recommendations there. He has high influence over whether the work is sound and none over whether it is approved.

Operations

Coordination role. Mara Ilyan, production operations manager, is the route between this analysis and the decision. She will carry the Week 2 recommendation into review whether it proposes proceeding, revising, deferring or declining, and carrying it does not approve the project (W03-S04).

Priorities. Operations needs a clear route for decisions and a usable summary of who must be consulted. She asks the analyst to distinguish people doing the work, people affected by it, people offering specialist advice, and the role that can authorize it. She has proposed a single daytime meeting while Nia has requested night-shift participation, and no agreement on timing is recorded (W03-S04).

What she can confirm. She can seek contact confirmation, which makes her the route for identifying the unnamed record custodian and the sponsor role. She can confirm the decision route, set the meeting format, and record disagreements and how each account will be checked (W03-S04).

What needs another decision-maker. She is not established as the spending approver (W03-S04). Authorization of the work and its funding sits with the sponsor role, which the packet does not identify (W03-S03). Technical interpretation sits with Elias, and whether the workflow fits night QA sits with Nia and an operator not yet selected.

Sponsor and record custodian

Authorizing sponsor.
Known responsibility: the sponsor role can authorize the proposed work within the organization's approval process, and Operations routes recommendations to it (W03-S03).
Missing named contact: the packet does not identify the person holding the role (W03-S03).
Authority needing confirmation: the specific approval limits attached to the role, and whether any approval has been given. W03-S03 records no signed approval. Until the holder is named and the limits stated, the decision right behind this review is undocumented.
Confirmation sought through Mara Ilyan as the route to the sponsor.

Record custodian.
Known responsibility: the proposed QA Control Review includes a record-custodian entry, and Elias Chen asks for that custodian to attend a short access discussion before delivery dates are promised (W03-S03,

W03-S02).
Missing named contact: the record-custodian entry has no named contact (W03-S03).
Authority needing confirmation: whether anyone has accepted the responsibility, and whether that person can authorize read-only export access. The supplied extract contains no confirmation that a custodian accepted the role (W03-S03).
Confirmation sought through Mara Ilyan via Operations.

For both roles, no name, approval or acceptance is assumed. A missing entry is a follow-up question, not proof that nobody in the organization holds the responsibility (W03-S03).

2. Relationships and next steps

Competing needs and tradeoff

The tension. Mara Ilyan proposes a single daytime meeting, which gives Operations one clear route for decisions and a usable summary (W03-S04). Nia Voss asks that review sessions be arranged around shift duties and that a night-shift operator participate in checking the workflow (W03-S01). Both needs are reasonable: Operations needs a decision route it can run; QA needs the people who actually work the cell to be heard.

Why they conflict. A single daytime meeting cannot include a night-shift operator without asking that person to attend outside their working hours. Nia states that one daytime meeting may be convenient for Operations but is not a plan for hearing the night shift.

Evidence status. W03-S04 records that no agreement on timing exists. Neither position has been withdrawn and neither has been accepted.

Proposed way through, not an agreement. Hold Mara's daytime meeting for the decision route, and add one short on-shift conversation with a selected operator before the workflow is finalized, with its findings brought into the daytime meeting by Nia. Mara confirms whether this is acceptable. This is my proposal for working through the tradeoff and must not be recorded as their agreement.

Consultation plan

QA, Nia Voss. Question: does the record-checking workflow fit night-shift use, and which times avoid shift duties? Method: short working session during her shift. When: first, since her answer sets the schedule. She can review workflow fit but cannot approve funding or a restart (W03-S01).

Engineering, Elias Chen. Question: what do the command and scheduler records show, and what source detail do the exports need? Method: short access discussion with the record custodian present, as he requests. When: after the custodian is named. He advises on feasibility; he cannot identify the command's origin or authorize spending (W03-S02).

Operations, Mara Ilyan. Question: what is the decision route to the sponsor, and who confirms the missing contacts? Method: daytime meeting, the format she proposes. When: after QA and Engineering, so she receives a consolidated list. She routes to the sponsor but is not the spending approver (W03-S04).

Record custodian, no named entry. Question: who accepted the role, and can read-only exports with source details be supplied, by when? Method: identification through Operations, then the access discussion with Elias. When: immediately, because this blocks the work downstream (W03-S03).

Authorizing sponsor, role unidentified. Question: who holds it, what are their approval limits, and what do they need in order to decide? Method: identification via Mara; no direct approach until the role is named. When: before detailed requirements work (W03-S03).

Night-shift operator, not yet selected. Question: how do you run the checks and record exceptions, and where does the proposed workflow break down in practice? Method: brief on-shift conversation at the workstation. When: after Nia helps select an operator, before the workflow is fixed (W03-S01).

Why low authority still needs a voice. The night-shift operator has no budget authority and no entry in the authority register, but performs the checks and records exceptions (W03-S01). That is low power with high stake: they hold knowledge nobody else has about how the workflow behaves at 2 a.m., which is when the incident occurred, and they absorb the consequences of whatever is designed. A workflow approved without them can pass review and still fail in use.

Missing voices and validation

Question 1: who is the record custodian? The register names QA, Engineering and Operations as participants, but its record-custodian entry has no named contact, and the extract contains no confirmation that anyone accepted the responsibility (W03-S03). Elias also needs that person present at an access discussion before delivery dates are promised (W03-S02). Who should seek confirmation: Mara Ilyan, who can seek contact confirmation through Operations (W03-S04). How the answer is recorded: an entry giving the named person, the date they confirmed, and the exact responsibility accepted. If no one is identified, that is recorded as an open question with the date asked, not left blank.

Question 2: who holds the authorizing sponsor role, and what are its limits? Operations routes recommendations to the sponsor, but the packet does not identify the person, their specific limits, or any signed approval (W03-S03). Who should seek confirmation: Mara Ilyan, as the route to the sponsor; the analyst does not approach the role directly until it is named. How the answer is recorded: the named role holder, the stated approval limit, and the date confirmed, with any approval referenced by source. An unnamed sponsor is recorded as an unresolved decision right.

Silence is not consent. A contact appearing on a meeting list is not evidence of consent, availability, ownership or decision authority (W03-S03). No answer, no attendance and no objection are each

recorded as asked on a given date with no response, never as agreement. A missing entry is a follow-up question, not proof that nobody in the organization holds that responsibility.

Next step toward requirements

What must be confirmed first. W03-S04 states the next step is to confirm missing participants and decision rights before gathering detailed requirements. Specifically: the record custodian, including who accepted the role and whether read-only exports with source details can be provided, which blocks the access discussion Elias requests (W03-S03, W03-S02); the authorizing sponsor, including who holds the role and what their approval limits are, since the packet names no person, no limits and no signed approval (W03-S03); the night-shift operator, who has not been selected or interviewed (W03-S01); and the meeting timing, since no agreement between the daytime proposal and night-shift participation is recorded (W03-S04).

How the map helps invite the right people. It separates who does the work, who is affected, who advises and who decides, so each person is invited to the conversation that matches their contribution. Elias attends the access discussion rather than a workflow session, and the operator is consulted on shift rather than asked to attend in the daytime. It also makes gaps visible as named vacancies, so an invitation list is not mistaken for a complete participant list.

Why this authorizes nothing. The map records responsibilities and decision rights; it does not exercise them. Identifying the sponsor role does not approve spending, and listing participants does not commit their time, since a contact on a meeting list is not evidence of consent, availability, ownership or decision authority (W03-S03). Mara carries the recommendation into review, and the request itself does not approve the project (W03-S04). My role ends at mapping whom to consult and recommending these confirmations; the sponsor authorizes the work.

3. Book evidence connection

Book form connection

Prompt 33's second question, asking what someone is responsible for and which decisions are explicitly not theirs to make, changed the structure of my consultation plan. I had grouped people by department with one question per group. Separating responsibility from authority in every entry is why the plan now records that Elias Chen advises on technical interpretation without owning the records or approving spending, and that Mara Ilyan routes the recommendation to the sponsor without being the spending approver. It also changed who I ask about what: the custodian question goes to Operations for identification rather than to Elias, because asking for an access discussion is not the same as holding the access.
